RAC (By similarity): Type II membrane protein (Potential):

C. --- FUNCTION: Probable protease. Seems to be capable of activating

RAC (By similarity): Type II membrane protein (Potential):

and ampullary cancer. Very weak expression in normal

and ampullary: Contains I Indi-receptor class A domain.

C. --- SIMILARITY: Contains I SRCR domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 gastric, colorectal

Bergeron; TISSUB=Mesocarp;
Mbeguie-A-Mbeguie D., Fils-Lycaon B.R.;
"Molecular cloning and nucleotide sequence of a 608 ribosomal protein
11 from apricot (Prunus armeniaca cv. Bergeron).";
Submitted (WAR-1999) to the EMBL/GenBank/DDBJ databases.
-: SIMILARITY: Belongs to the L4E family of ribosomal proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Prunus armeniaca (Apricot).

Hartley L. Wang C.-C. Harvey R.P., Begley C.G.;

Robb L. Hartley L. Wang C.-C. Harvey R.P., Begley C.G.;

Twisculin: a murine basic helix-loop-helix transcription factor gene expressed in embryonic skeletal muscle.";

McGr. Dev. 76:197-201(1998).

L. McGr. Dev. 76:197-201(1998).

-!- FUNCTION: Transcription repressor capable of inhibiting the transactivation capability of E47. May play a role in regulating antigen-dependent B-cell differentiation.

-!- SUBURIT: Efficient DNA binding requires dimerization with another bhill protein. Binds DNA as a homodimer or a heterodimer. Forms a heterodimer with E12/E47.

-!- SUBCELIULAR LOCATION Nuclear.

-!- TISSUE SEPECIFICITY: Expressed in lymphoid tissues, B-cell lines and activated B cells.

-!- SIMILARITY: Contains 1 basic helix-loop-helix (bHIR) domain.

                                To the G box (5'-CACGTG-3').

Subuntry: Homodimer (Probable). Can form a heterodimer with REP1.

Phytochrome B binds specifically to DNA-bound PIF3, but only upon red light induced conversion to the Pfr form (PfrB). Reconversion to Pr form causes rapid dissociation.

SUBCELLULAR LOCATION: Nuclear.

SUBCELLULAR LOCATION: Nuclear.

SIMILARITY: Contains 1 basic helix-loop-helix (bHLH) domain.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Note=No experimental confirmation available;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: High level of expression in liver, lung and testis. Also expressed in heart, brain, spleen, thymus and bone marrow. Highly expressed in progenitors and myeloid cells. Isoform 2 is expressed in primary hemotopoietic cells.
INDUCTION: Upregulated in the myeloid 32D cell line by granulocyte colony stimulating factor (G-CSF).
COMMAN: The WSXWS motif appears to be necessary for proper protein folding and thereby efficient intracellular transport and cellsurface receptor binding.
-:- DOMAIN: The BOX I motif is important for association with JAKS.
-:- SIMILARITY: Belongs to the type I cytokine family of receptors.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Nature 400:685-690(2001).

-!- FUNCTION: Receptor for thymic stromal lymphopoietin (TSLP). Forms a functional complex with TSLP and IL/7R which is capable of stimulating cell proliferation through activation of STAT3 and STAT5. Also activates JAK2. Implicated in the development of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       hematopoietic system.
-!- SUBCELLULAR LOCATION: Type I membrane protein (isoform 1 and isoform 3). Secreted (isoform 2).

linkages in glycogen by scission of a 1,4-alpha-11,need
oligosaccharide from growing alpha-1,4-glucan chains and the
subsequent attachment of the oligosaccharide to the alpha-1,6
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   position.
CATALYTIC ACTIVITY: Formation of 1,6-glucosidic linkages of
                                                                                                                                                                                                                                                                                                                             ó
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  -!- PATHARY: Starch biosynthesis; third step.
-!- SUBUNIT: Monomer (By similarity).
-!- SUBCELLULAR LOCATION: Chloroplast; amyloplast.
-!- SIMILARITY: Belongs to family 13 of glycosyl hydrolases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    01-NOV-1995 (Rel. 32, Created)

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    J. Am. Soc. Nephrol. 11:828-834 (2000).
-!- FUNCTION: Possesses a trypsin-like cleavage specificity (By similarity). Activates amiloride-sensitive sodium channels.
-!- SUBDNIT: Heterodimer of two chains, light and heavy, held by a disulfide bond (By similarity).
                                                                                                                                                                                                                                                                                                                                                                                                                                               16-OCT-2001 (Rel. 40, Created)
